POWER BI · ACTIVITY 2

Sales vs Target

Metro Grocers · Variance Analysis (from CSV)

You are the analyst for Metro Grocers, a Philippine supermarket chain. Management set annual sales targets per category. Import the two CSV files, connect them, and build a dashboard that shows where actual sales beat target and where they fell short.

Your data — two CSV files

Import both with Get data → Text/CSV:

• MetroGrocers_Sales.csv — 320 orders (Date, Region, Category, Product, Segment, Quantity, Unit Price, Sales, Cost, Profit).

• MetroGrocers_Targets.csv — one annual Sales Target per Category.

Set up the model

1. Import both CSVs (check data types on the way in — CSV stores none).
2. In Model view, drag Targets[Category] onto Sales[Category] to relate them (one-to-many).
3. Now a measure can compare the two.

Must include

- ✓ KPIs: Total Sales, Total Target, Variance, Variance %
- ✓ Clustered bar: Sales vs Target by Category
- ✓ Bar: Variance by Category
- ✓ Slicers: Date, Region, Category
- ✓ Title + consistent theme

New measures (DAX)

```
Total Sales
= SUM(Sales[Sales])
Total Target
= SUM(
    Targets[Annual Sales Target])
Variance
= [Total Sales]
  - [Total Target]
Variance %
= DIVIDE(
    [Variance], [Total Target])
```

Check figures

Total Sales	PHP 1,118,140
Total Target	PHP 1,104,000
Variance	**+PHP 14,140**

Submit as "Dashboard Activity 2" on the ExcelHelpline hub, using the same name and email as always. This is submission 2 of 3 toward your Power BI certificate.
