POWER BI · FINAL PROJECT (HOMEWORK)

Tindahan Trading

Build a full sales dashboard from two connected tables

You are the data analyst for Tindahan Trading, a Philippine general-merchandise distributor. Build one complete, interactive sales dashboard from its two-table dataset. This is your capstone for the Power BI module — it pulls together everything from Weeks 1 and 2.

Your data — one workbook, two tables

TindahanTrading_FinalProject.xlsx

- Sales (fact) — 420 orders: Order Date, Region, Store, Product ID, Quantity, Unit Price, Sales, Cost, Profit, Payment Method.
- Products (lookup) — 24 products: Product ID, Product Name, Category, Supplier, List Price.

The Sales table has NO Category column — you must relate it to Products on Product ID to analyze by category. That relationship is the whole point of this project.

Set up the model

1. Import both sheets (Get data → the workbook → tick Sales and Products).
2. Model view: drag Products[Product ID] onto Sales[Product ID] — one-to-many.
3. Products is the 'one' (lookup); Sales is the 'many' (facts).

Must include

- ✓ Import both tables
- ✓ Relationship on Product ID
- ✓ KPIs: Sales, Profit, Orders, Margin %
- ✓ A chart using a Products field (e.g. Sales by Category)
- ✓ Line: Sales by Month
- ✓ A Region or Store visual
- ✓ Slicers: Date, Region, Category, Payment Method
- ✓ Title, theme + one written insight

Measures (DAX)

```
Total Sales
= SUM(Sales[Sales])
Total Profit
= SUM(Sales[Profit])
Total Orders
= DISTINCTCOUNT(
    Sales[Order ID])
Profit Margin %
= DIVIDE(
    [Total Profit],
    [Total Sales])
```

Check figures

Total Sales	PHP 323,778
Total Profit	PHP 130,923
Total Orders	420
Profit Margin	**40.4%**

Submit as "Homework" on the ExcelHelpline hub, using the same name and email as always. Homework is submission 3 of 3 — with Activity 1 and Activity 2, it earns your Power BI certificate.
